100 Multiple-Choice Questions

Foundations of Information Systems

Part I — Core System Concepts

1. What is a primary role of information systems?

A. Run daily operations and support decisions
B. Replace every worker in every department
C. Store unrelated files without business purposes
D. Prevent all risks in every organization

Correct answer: A. Explanation: The presentation explains that information systems run daily operations and support strategic decisions.

2. What productivity advantage does the chapter report for effective IS use?

A. About fifteen to twenty percent higher productivity
B. About five to ten percent higher productivity
C. About thirty to forty percent higher productivity
D. About fifty to sixty percent higher productivity

Correct answer: A. Explanation: Page 3 reports 15–20% higher productivity for companies that use IS capabilities effectively; the slide does not identify the figure's source.

3. Which sequence represents the core system loop?

A. Input, processing, output, and feedback
B. Hardware, software, people, and procedures
C. Investigation, analysis, design, and maintenance
D. Sales, finance, inventory, and payroll

Correct answer: A. Explanation: Page 4 describes input, processing, output, and feedback as the basic system loop.

4. What happens during the input stage?

A. Raw data enters the information system
B. Data is transformed into useful reports
C. Results change future system activities in
D. Managers compare alternative business scenarios in

Correct answer: A. Explanation: Input is the stage at which raw data enters the system.

5. What happens during processing?

A. Data is transformed and analyzed in
B. Raw data first enters the system
C. Useful reports are distributed to users
D. Feedback changes future input levels in

Correct answer: A. Explanation: Processing transforms and analyzes the data that entered the system.

6. Which is an example of system output?

A. A receipt and daily sales report
B. A barcode scanned at checkout in
C. A low-stock signal triggering a reorder
D. A keyboard used to enter data

Correct answer: A. Explanation: The checkout example identifies the receipt and daily sales report as outputs.

7. What is feedback in the core system model?

A. Results inform future inputs and adjustments in

B. Raw facts enter the system for processing
C. Instructions tell hardware what to do in
D. Reports summarize routine business transactions in this

Correct answer: A. Explanation: Feedback uses results to adjust future inputs or actions, closing the system loop.

8. How many interconnected components does the presentation identify?

A. Five components in an information system
B. Three components in an information system
C. Four components in an information system
D. Seven components in an information system

Correct answer: A. Explanation: Page 5 identifies hardware, software, databases, networks, and people/procedures.

9. What is hardware?

A. The physical devices in a system in
B. The instructions that govern hardware in this
C. The organized data stored by a business
D. The people who use the system daily

Correct answer: A. Explanation: Hardware refers to the physical devices that make up an information system.

10. What is software?

A. Instructions that tell hardware what to do
B. Physical devices that process raw data in
C. A collection of related customer records in
D. A network connecting distant business locations in

Correct answer: A. Explanation: Software provides instructions that govern the operation of hardware.

Part II — The Five Components

11. What is a database?

A. An organized collection of related data in this
B. A physical device used to display results in
C. A program that controls memory and files in
D. A group of users who operate the system

Correct answer: A. Explanation: Page 8 defines a database as related data that can be accessed, managed, and updated efficiently.

12. Why is a database called organizational memory?

A. It stores records for later access and use
B. It connects devices across distant locations in this
C. It manages the physical operation of hardware in
D. It provides rules for employee behavior in this

Correct answer: A. Explanation: Databases hold customer records and transaction histories, acting as organizational memory.

13. What is the role of networks?

A. Connect components and enable data sharing
B. Manage computer memory and system files
C. Store all customer and transaction records
D. Define policies for using business applications

Correct answer: A. Explanation: Networks connect people and devices across locations and enable communication and data sharing.

14. Which is listed as a network-related environment?

A. An intranet within an organization
B. An employee payroll report in
C. A computer keyboard at checkout
D. A system development interview in

Correct answer: A. Explanation: The presentation lists the Internet, intranets, extranets, and cloud computing in its networks section.

15. Who are end users?

A. People who use the system every day
B. People who only design network hardware in
C. People who write laws for data privacy
D. People who supply raw materials to factories

Correct answer: A. Explanation: End users are the people who use an information system in their daily work.

16. What do IT professionals do?

A. Build, operate, and maintain systems in
B. Only enter daily sales transactions in
C. Only approve employee leave requests in
D. Only purchase products through mobile devices

Correct answer: A. Explanation: The presentation describes IT professionals as the people who design, build, and maintain systems.

17. Why do procedures and policies matter?

A. They govern how the system is used
B. They replace the need for any users
C. They store every transaction in a database
D. They perform all processing without software in

Correct answer: A. Explanation: Policies and procedures establish the rules governing system use.

18. Which group is a hardware input device?

A. Keyboard, touchscreen, and scanner in this
B. Monitor, printer, and speaker in this
C. CPU, server, and processor in this
D. Hard drive, cloud store, and archive

Correct answer: A. Explanation: Page 6 lists keyboards, touchscreens, and scanners as input devices.

19. Which group contains processing units?

A. CPUs and servers in this
B. Monitors and printers in this
C. Keyboards and scanners in this
D. Hard drives and cloud storage

Correct answer: A. Explanation: The hardware slide identifies CPUs and servers as processing units.

20. Which group contains output devices?

A. Monitors and printers in this
B. Keyboards and touchscreens in this
C. CPUs and servers in this
D. Hard drives and cloud storage

Correct answer: A. Explanation: Monitors and printers are output devices.

Part III — Hardware, Software, and Networks

21. Which is a storage system example?

A. A hard drive or cloud storage
B. A keyboard or barcode scanner in
C. A monitor or office printer in
D. A CPU or application window in

Correct answer: A. Explanation: The hardware categories include hard drives and cloud storage as storage systems.

22. What does system software do?

A. Manages hardware operations and resources in this
B. Performs a specific task for the user
C. Stores related records for later access in
D. Connects users across separate locations in this

Correct answer: A. Explanation: System software manages hardware operations; the operating system is the key example.

23. What does application software do?

A. Performs specific tasks for users in
B. Manages memory, files, and devices in
C. Connects private networks to the Internet
D. Defines policies for system access in

Correct answer: A. Explanation: Application software performs tasks such as accounting, inventory management, or browsing.

24. How is a web browser classified in the presentation?

A. Application software for a user task
B. System software for managing hardware in
C. A database for storing transaction histories
D. A network for connecting business locations

Correct answer: A. Explanation: The speaker notes classify a web browser as application software because it performs a user task.

25. What is an intranet?

A. A private network within one organization
B. A public marketplace for online purchases
C. A database of customer transaction records
D. A program for managing computer memory

Correct answer: A. Explanation: The speaker notes describe an intranet as a private network inside an organization.

26. What is an extranet?

A. A private network extended to selected outsiders in
B. A public network available to everyone equally in
C. A database that stores internal business records in
D. A device that converts data into printed reports

Correct answer: A. Explanation: An extranet extends a private network to selected outsiders, such as suppliers or partners.

27. What are data?

A. Raw and unorganized facts in
B. Processed facts in meaningful context
C. Interpretations used to make decisions
D. Policies governing access to systems

Correct answer: A. Explanation: The presentation defines data as raw, unorganized facts.

28. What is information?

A. Data organized in a meaningful context

B. Raw facts without relationships or meaning
C. Interpretation used to decide or act
D. Physical equipment that processes records in

Correct answer: A. Explanation: Information is data that has been processed and organized in meaningful context.

29. What is knowledge?

A. Understanding information to decide or act in
B. Raw facts collected from business operations in
C. Reports created from transaction summaries in this
D. Hardware used to store and process data

Correct answer: A. Explanation: Knowledge is the interpretation of information used for decisions and action.

30. In the temperature example, what are the numbers 38, 41, 39, 42, and 40?

A. Raw data before meaningful interpretation in
B. Knowledge already applied to a decision
C. A structured report for middle managers
D. A system's feedback after a reorder

Correct answer: A. Explanation: The slide uses these numbers as raw data before context is added.

Part IV — Data, Information, and Knowledge

31. What makes the average temperature an example of information?

A. The facts are organized in meaningful context
B. The numbers remain entirely unexplained in this
C. The values directly replace the database in
D. The facts are used without interpretation in

Correct answer: A. Explanation: The temperatures become information when identified as a week's readings in Cairo and summarized as an average.

32. What is an example of knowledge in the temperature scenario?

A. Moving outdoor sport to the morning
B. Recording the numbers without context in
C. Calculating a total from raw transactions
D. Storing temperature values in a database

Correct answer: A. Explanation: Interpreting the heatwave and changing the sports schedule applies information to action.

33. Which system sits at the operational level?

A. Transaction processing system in
B. Decision support system in
C. Management information system in
D. Enterprise resource planning only

Correct answer: A. Explanation: The system pyramid places TPS at the operational base.

34. What does a TPS record?

A. Daily transactions such as sales and payroll
B. Only complex strategic scenarios in this chapter
C. Only regular summaries for middle managers in
D. Only integrated plans across every department in

Correct answer: A. Explanation: TPS records routine daily transactions, including sales, inventory, and payroll.

35. Why are TPS foundational to other business systems?

A. They capture the raw data others analyze
B. They make all strategic decisions independently in
C. They replace every department's shared database in
D. They only create long-term what-if models in

Correct answer: A. Explanation: MIS, DSS, and ERP rely on data captured by TPS.

36. What does an MIS produce for managers?

A. Structured reports summarizing transactions in this
B. Unstructured models for complex decisions in
C. Raw scans without totals or trends
D. Only instructions for hardware operations in

Correct answer: A. Explanation: MIS summarizes transaction data into structured reports for middle managers.

37. Which is a typical MIS report?

A. Weekly sales totals by branch in this
B. A barcode scan before processing in this
C. A scenario model for a new branch
D. A policy governing data encryption in this

Correct answer: A. Explanation: The presentation lists weekly sales by branch as a typical MIS report.

38. What kinds of decisions does MIS support?

A. Routine decisions based on structured reports
B. Complex decisions without standard procedures in
C. Only moral decisions about autonomous cars
D. Only software architecture decisions in this

Correct answer: A. Explanation: MIS supports monitoring and routine decisions using regular, predictable reports.

39. What does a DSS support?

A. Complex decisions using models and analysis
B. Routine transactions recorded one by one
C. Regular reports of payroll totals only
D. Hardware operations and memory management in

Correct answer: A. Explanation: DSS helps with complex or unstructured decisions using analytical tools and models.

40. What question is associated with DSS?

A. What if this scenario happens? in
B. What were the routine totals yesterday?
C. Which barcode was scanned at checkout?
D. Which device stores the transaction records?

Correct answer: A. Explanation: The slide contrasts DSS's 'What if?' analysis with MIS's 'What happened?' reports.

Part V — Core Business Systems

41. How does MIS differ from DSS?

A. MIS reports routine results; DSS models scenarios
B. MIS models scenarios; DSS records every sale
C. MIS manages hardware; DSS stores customer records
D. MIS connects networks; DSS governs user policies

Correct answer: A. Explanation: MIS focuses on structured problems and regular reports; DSS focuses on complex decisions and what-if analysis.

42. What does ERP integrate?

A. Business processes across departments in
B. Only sales transactions at checkout
C. Only the strategic management layer
D. Only one team's local spreadsheet

Correct answer: A. Explanation: ERP integrates processes across departments and organizational levels.

43. What is a key ERP benefit?

A. A shared database and consistent information in
B. Separate departmental records with duplicated entries in
C. Independent data that frequently disagree in this
D. A ban on data sharing across departments

Correct answer: A. Explanation: The presentation describes ERP as a single source of truth using a shared database.

44. Which departments might share ERP data?

A. Sales, finance, HR, and warehouse in
B. Only marketing, customers, and suppliers in
C. Only IT, networks, and printers in
D. Only the CEO and external auditors

Correct answer: A. Explanation: The ERP slide illustrates sales, finance, HR, and warehouse working with a shared database.

45. What is e-commerce?

A. Business activity through digital marketplaces in
B. Buying and paying only with cash
C. A private network inside an organization
D. A model for complex strategic decisions

Correct answer: A. Explanation: The presentation associates e-commerce with digital marketplaces.

46. What is m-commerce?

A. Buying and paying through mobile devices in this
B. Managing memory and files in an operating system
C. Processing routine payroll transactions in a TPS in
D. Summarizing branch sales in a regular report in

Correct answer: A. Explanation: M-commerce refers to commerce through mobile devices.

47. What does artificial intelligence include in the slide?

A. Machine learning and automated decision-making in
B. Only keyboard input and printer output
C. Only database storage and network routing
D. Only manual reports and paper procedures

Correct answer: A. Explanation: The emerging technologies slide describes AI in terms of machine learning and automated decisions.

48. What is an expert system?

A. Knowledge-based software mimicking human expertise in this
B. A device for connecting computers over distance
C. A report that summarizes routine transactions in
D. A storage service for customer records in

Correct answer: A. Explanation: Expert systems use knowledge-based problem solving to mimic human expertise.

49. What is the first SDLC phase?

A. Investigation
B. Analysis

C. Design
D. Maintenance

Correct answer: A. Explanation: The SDLC begins with investigation to identify problems, opportunities, and feasibility.

50. What happens during investigation?

A. Identify problems and assess feasibility in
B. Architect interfaces and databases in this
C. Build, test, and deploy the system
D. Provide ongoing fixes and enhancements in

Correct answer: A. Explanation: Investigation involves identifying problems or opportunities and gathering requirements while checking feasibility.

Part VI — SDLC and Agile Development

51. What happens during analysis?

A. Document requirements and study current systems in
B. Train users and migrate legacy data in
C. Provide ongoing support and bug fixes in
D. Choose colors for the system interface only

Correct answer: A. Explanation: Analysis examines current systems, documents requirements, and writes detailed specifications.

52. What happens during system design?

A. Plan components, interfaces, and databases
B. Identify whether the problem exists
C. Train users after deployment in
D. Fix defects reported during maintenance

Correct answer: A. Explanation: Design defines the architecture, interfaces, databases, and integration points.

53. What is included in implementation?

A. Build, test, deploy, and train users
B. Only identify problems and opportunities in
C. Only document current requirements in this
D. Only provide long-term support and fixes

Correct answer: A. Explanation: Implementation includes building, testing, deploying, training users, and migrating legacy data.

54. What is maintenance?

A. Ongoing support, fixes, and improvements
B. The first assessment of feasibility
C. The initial collection of requirements
D. The architectural plan for databases

Correct answer: A. Explanation: Maintenance provides ongoing support, bug fixes, and enhancements based on feedback.

55. What is the primary goal of the SDLC?

A. Balance user, technical, and business needs
B. Maximize the number of system phases
C. Avoid documenting system requirements in this
D. Remove users from design and implementation

Correct answer: A. Explanation: The presentation says SDLC aims to balance user needs, technical constraints, and business objectives.

56. How does Waterfall development usually proceed?

A. One long sequence of completed phases
B. Short cycles with continuous user feedback
C. Independent releases without planned stages in
D. A shared database across all departments

Correct answer: A. Explanation: Waterfall completes phases sequentially, and users generally see the result at the end.

57. What characterizes Agile development?

A. Short cycles, feedback, and adaptive planning in this
B. One long sequence with feedback at the end
C. No user involvement until final deployment in this
D. A fixed plan that cannot be adjusted in

Correct answer: A. Explanation: Agile uses short iterative cycles, continuous user feedback, and adaptive planning.

58. What is one advantage of Agile over Waterfall?

A. Faster and more flexible delivery in this
B. No need to test working software in
C. No need to involve users in development
D. Guaranteed success for every project in this

Correct answer: A. Explanation: The presentation says Agile supports faster, more flexible delivery.

59. What is one advantage of building software in-house?

A. Greater customization and control in this
B. Faster deployment in every situation in
C. Lower development cost in every case
D. Complete reliance on vendor expertise in

Correct answer: A. Explanation: In-house development offers greater customization and full control, but typically costs more.

60. What is one advantage of buying off-the-shelf software?

A. Specialized expertise and faster deployment in
B. Full control over every product feature
C. Perfect fit for every unique process
D. No dependency on an external vendor

Correct answer: A. Explanation: Commercial packages use vendor expertise and can be deployed faster.

Part VII — Build Versus Buy and Ethical Issues

61. What is a trade-off of buying off-the-shelf software?

A. Less tailoring and less control in
B. Greater customization and full control in
C. No need for system implementation in
D. Guaranteed elimination of all operating costs

Correct answer: A. Explanation: The slide notes that bought software may be less tailored and provide less control.

62. What is a central data privacy concern?

A. Consent and control over personal information in
B. The number of keyboards used in offices
C. The speed of a computer's processor in
D. The size of a system's monitor in

Correct answer: A. Explanation: The presentation highlights consent, transparency, and individual control over personal data.

63. Which is a cybersecurity threat named in the presentation?

A. Ransomware and data breaches
B. A user-centered interface in
C. An Agile feedback cycle
D. A structured sales report

Correct answer: A. Explanation: The cybersecurity slide names ransomware, data breaches, and sophisticated attacks.

64. What ethical question can arise with driverless cars?

A. Whose safety should the algorithm prioritize? in
B. Which department should store sales totals? in
C. How many printers should an office buy?
D. Which phase comes first in the SDLC?

Correct answer: A. Explanation: The presentation asks whether a driverless car should protect its passenger or a pedestrian.

65. What is a governance framework used for?

A. Set clear data-handling and access policies
B. Replace encryption with unrestricted access in
C. Eliminate the need for regulatory compliance
D. Make all systems available to everyone

Correct answer: A. Explanation: Governance frameworks provide clear policies for handling data and granting system access.

66. What does encryption protect?

A. Sensitive data in transit and at rest in
B. Only printed reports after delivery in this chapter
C. Only the physical devices in a server room
D. Only the user interface during design in this

Correct answer: A. Explanation: The slide recommends encryption while data travels across networks and while it is stored.

67. Which regulation is named for data protection?

A. GDPR
B. Agile
C. ERP
D. TPS

Correct answer: A. Explanation: The presentation names GDPR as a data-protection regulation.

68. Which regulation is associated with health information in the presentation?

A. HIPAA
B. CRM
C. DSS
D. SDLC

Correct answer: A. Explanation: The slide describes HIPAA as a United States law on health information.

69. What does multi-factor authentication support?

A. Advanced cybersecurity and stronger access control
B. Routine sales reporting for middle managers
C. Faster database updates without user verification
D. A replacement for all governance policies

Correct answer: A. Explanation: The best-practices slide associates multi-factor authentication and zero trust with advanced cybersecurity.

70. What is zero trust grouped with in the presentation?

A. Advanced cybersecurity practices in this
B. Database design and storage systems
C. Continuous improvement of production lines
D. Mobile commerce and online payments

Correct answer: A. Explanation: The slide lists multi-factor authentication and zero trust under advanced cybersecurity.

Part VIII — Security Safeguards and Best Practices

71. What is data-driven decision making?

A. Using analytics to turn data into insight
B. Choosing actions without examining information in this
C. Keeping transaction data isolated by department in
D. Replacing reports with unverified assumptions in this

Correct answer: A. Explanation: The presentation says business intelligence and analytics turn data into insight for decisions.

72. What is user-centered design intended to improve?

A. Adoption and ease of learning the system in
B. The number of management layers in a company
C. The amount of raw data collected at checkout
D. The complexity of every user interface in this

Correct answer: A. Explanation: The presentation links user-centered design to higher adoption and less training time.

73. What is sustainable IT intended to reduce?

A. Energy use through efficient technology in
B. Data accuracy through repeated processing in
C. Customer loyalty through fewer service options
D. User access through more complex passwords

Correct answer: A. Explanation: The slide mentions green data centers and efficient hardware as ways to reduce energy consumption.

74. What does the chapter report about data-driven decisions?

A. Up to twenty-five percent better decisions
B. Up to fifteen percent better decisions
C. Up to forty percent better decisions
D. Up to sixty percent better decisions

Correct answer: A. Explanation: Page 22 reports up to 25% better decisions; the slide does not cite the source, so this is a reported figure.

75. What reported result is linked to advanced cybersecurity?

A. Sixty percent fewer successful breaches
B. Thirty percent fewer successful breaches
C. Twenty-eight percent fewer successful breaches
D. Forty percent fewer successful breaches

Correct answer: A. Explanation: The slide reports 60% fewer successful breaches for advanced cybersecurity approaches.

76. What reported result is linked to Agile development?

A. Twenty-eight percent more projects succeed
B. Twenty percent more projects succeed
C. Forty percent more projects succeed

D. Sixty percent more projects succeed

Correct answer: A. Explanation: The slide reports Agile projects succeed 28% more often than Waterfall projects.

77. What reported benefit is linked to user-centered design?

A. Up to forty percent less training time
B. Up to twenty-five percent less training time
C. Up to thirty percent less training time
D. Up to sixty percent less training time

Correct answer: A. Explanation: The slide reports up to 40% less training time with user-centered design.

78. What reported benefit is linked to sustainable IT?

A. Thirty percent less energy used
B. Twenty percent less energy used
C. Twenty-eight percent less energy used
D. Forty percent less energy used

Correct answer: A. Explanation: The slide reports a 30% reduction in energy use; these values are presented as reported figures in the chapter.

79. What is the purpose of Think-Pair-Share in the presentation?

A. Discuss which system component is most critical
B. Calculate payroll totals from raw transactions in
C. Design encryption for stored customer records in
D. Compare Waterfall phases with ERP departments in

Correct answer: A. Explanation: The activity asks learners to choose and discuss which of the five components is most critical.

80. What does the Whirlpool case study examine?

A. Challenges and lessons from ERP implementation
B. The difference between data and knowledge
C. How mobile commerce processes payments in
D. How hardware devices are classified in

Correct answer: A. Explanation: The presentation asks students to examine Whirlpool's ERP journey and its lessons.

Part IX — Applied Business Scenarios

81. What tension is explored in the security debate?

A. Security versus convenience in user experience in
B. Input versus output in a transaction system
C. Hardware versus software in system architecture in
D. Investigation versus analysis in the SDLC in

Correct answer: A. Explanation: The group debate asks when security and convenience conflict, such as with two-factor login.

82. What is the mini design workshop about?

A. Designing a campus events management system in
B. Creating a new mobile phone processor in
C. Writing a law on personal data privacy
D. Building a warehouse without information systems in

Correct answer: A. Explanation: The activity asks groups to design a campus events system using SDLC phases.

83. Which system records a sale and reduces stock in real time?

A. Transaction processing system
B. Decision support system
C. Management information system
D. Expert system in

Correct answer: A. Explanation: The retail example says each checkout scan records a sale and updates stock through TPS.

84. Which system would help compare opening a second branch?

A. Decision support system in
B. Transaction processing system in
C. Payroll transaction system in
D. Basic hardware control system

Correct answer: A. Explanation: A DSS can model what-if scenarios and compare options before a decision is made.

85. Which system provides a weekly sales report by branch?

A. Management information system
B. Decision support system
C. Operating system in
D. Expert system in

Correct answer: A. Explanation: MIS produces structured periodic reports such as weekly sales by branch.

86. Which system reduces inconsistent records across departments?

A. Enterprise resource planning system
B. Standalone payroll transaction system
C. Single-user spreadsheet application in
D. Basic web browser application

Correct answer: A. Explanation: ERP integrates departments through a shared database, reducing duplicate and inconsistent records.

87. What is the main value of connecting the five components?

A. They jointly collect, process, store, and share information
B. They independently replace every business process in this
C. They eliminate the need for users and procedures
D. They guarantee that every decision is always correct

Correct answer: A. Explanation: The five interconnected components work together to collect, process, store, and disseminate information.

88. Which statement best summarizes the data-information-knowledge sequence?

A. Facts are organized, interpreted, and used to act
B. Facts are stored, encrypted, and always deleted in
C. Reports are printed, scanned, and turned into hardware
D. Users are trained, hired, and moved between departments

Correct answer: A. Explanation: The presentation distinguishes raw data, organized information, and knowledge used to make decisions or take action.

89. Which statement best summarizes the role of information systems?

A. They support operations, decisions, and organizational goals
B. They only store files without processing data
C. They are useful only to IT professionals
D. They remove all ethical and security challenges

Correct answer: A. Explanation: The chapter frames IS as a foundation for daily operations, strategic decisions, and professional work.

90. Which component is described as the organization's memory?

A. Database

B. Network
C. Hardware
D. Software

Correct answer: A. Explanation: The presentation calls the database the organization's memory because it stores related records for access and reuse.

Part X — Review and Integration

91. What can happen if a TPS fails or records incorrect data?

A. Higher-level reports may also be incorrect
B. The organization automatically gains better insights
C. ERP stops needing shared data in
D. All cybersecurity threats disappear in this

Correct answer: A. Explanation: The speaker notes explain that if TPS data are wrong or unavailable, higher-level reports can also be wrong.

92. Which type of decision is usually structured?

A. A routine decision with a standard procedure
B. A complex decision with no standard procedure
C. A moral dilemma about autonomous vehicles in
D. A scenario requiring many uncertain assumptions in

Correct answer: A. Explanation: The presentation associates structured problems and routine decisions with MIS.

93. Which type of problem is usually unstructured?

A. A complex problem without a standard procedure
B. A regular task with a predictable report
C. A barcode scan at checkout in this
D. A monthly payroll total in this chapter

Correct answer: A. Explanation: DSS is used for unstructured problems that need modeling and analysis.

94. What is a potential consequence of separate departmental data silos?

A. Duplicate records and inconsistent numbers
B. One shared source of truth
C. Automatic synchronization across all departments
D. Fewer inconsistencies in every report

Correct answer: A. Explanation: The ERP slide shows that separate departmental records can be duplicated and disagree.

95. What does the implementation phase include when legacy systems are involved?

A. Migrating legacy data into the new system
B. Only gathering initial stakeholder requirements in this
C. Only planning the system architecture in this
D. Only fixing issues after deployment in this

Correct answer: A. Explanation: Implementation includes building, testing, deploying, training users, and migrating legacy data.

96. Why can Waterfall be costly when requirements change?

A. Returning to earlier completed phases is expensive
B. Users receive working pieces after every cycle
C. Planning adjusts continuously from feedback in this
D. Every phase can be skipped without impact

Correct answer: A. Explanation: The presentation explains that changes midway through Waterfall can make going back expensive.

97. Which example illustrates encryption in transit?

A. HTTPS protecting data as it travels in this
B. A policy listing who can access systems in
C. A hard drive storing archived files in this
D. A user training session about a new app

Correct answer: A. Explanation: The speaker notes use HTTPS as an example of encryption in transit.

98. Which example illustrates encryption at rest?

A. Protecting data stored on a disk in this
B. Encrypting data while it travels across a network
C. Summarizing transactions into a weekly report in this
D. Using an interface designed for end users in

Correct answer: A. Explanation: Encryption at rest protects stored data, including if a disk or laptop is stolen.

99. Why should reported percentages in the slides be treated carefully?

A. The presentation does not identify their sources
B. They are guaranteed for every organization in
C. They apply only to hardware purchases in
D. They replace the need to evaluate outcomes

Correct answer: A. Explanation: The speaker notes say the reported percentages are reproduced from the chapter and their sources are not named.

100. Which is a reasonable use of an expert system?

A. Suggesting a diagnosis using specialist rules
B. Recording every checkout transaction in this
C. Connecting remote offices through an intranet
D. Producing a weekly sales-by-branch report in

Correct answer: A. Explanation: The presentation describes an expert system as applying knowledge and rules collected from specialists, for example to suggest a diagnosis.
