# 100 Multiple-Choice Questions

## Part I — Information Systems and Core Concepts

**1. What is an information system?**

A. A set of related components meeting objectives
B. A single computer used for calculations in
C. A collection of unrelated files and devices
D. A network used only for online shopping

**Correct answer: A.** Explanation: An information system consists of interrelated components that collect, manipulate, store, distribute data and information, and provide feedback to meet an objective.

**2. Which activity is part of an information system?**

A. Collecting and processing data in
B. Replacing every human decision in
C. Preventing all organizational expenses in
D. Using computers without defined goals

**Correct answer: A.** Explanation: The lecture lists collecting, manipulating, storing, distributing, and providing feedback as information-system activities.

**3. What are data?**

A. Raw facts not yet organized in
B. Reports arranged for decision makers in
C. Rules used to operate a system
D. Knowledge applied to solve problems in

**Correct answer: A.** Explanation: Data are raw facts, such as an employee number, hours worked, or a product code.

**4. Which is an example of alphanumeric data?**

A. Letters, numbers, and characters in
B. Photographs and graphic illustrations in
C. Sounds, noise, and musical tones
D. Moving pictures and recorded scenes

**Correct answer: A.** Explanation: Alphanumeric data consist of numbers, letters, and other characters.

**5. Which data type includes graphic pictures?**

A. Image data
B. Audio data
C. Video data
D. Alphanumeric data

**Correct answer: A.** Explanation: The lecture classifies graphic images and pictures as image data.

**6. Which data type includes sound and tones?**

A. Audio data
B. Image data
C. Video data
D. Alphanumeric data

**Correct answer: A.** Explanation: Audio data include sound, noise, and tones.

**7. Which data type includes moving pictures?**

A. Video data

B. Image data
C. Audio data
D. Alphanumeric data

**Correct answer: A.** Explanation: Video data are moving images or pictures.

**8. What is information?**

A. Organized facts with additional value
B. Unprocessed facts with no relationships
C. Computer equipment used for processing
D. Rules for operating business software

**Correct answer: A.** Explanation: Information is a collection of facts organized so that it has additional value beyond the facts themselves.

**9. How does information gain value from data?**

A. By defining relationships among facts in
B. By keeping every fact disorganized in
C. By removing all context from records
D. By replacing data with hardware in

**Correct answer: A.** Explanation: Organizing facts and defining relationships among them creates information.

**10. What does knowledge help people do?**

A. Select, organize, and manipulate data in
B. Replace every database with a report
C. Turn hardware directly into software in
D. Eliminate the need for feedback in

**Correct answer: A.** Explanation: Knowledge guides the selection, organization, and manipulation of data to make it useful.

## Part II — Data, Information, Knowledge, and Value

**11. Which action is part of transforming data?**

A. Selecting relevant facts in this lecture
B. Ignoring relationships among facts in this
C. Removing useful information from reports in
D. Keeping all facts in random order

**Correct answer: A.** Explanation: The slide identifies selecting, organizing, and manipulating as steps in the transformation process.

**12. What can measure the value of information?**

A. Decision time and increased profit in
B. Computer size and keyboard color in
C. Number of cables and screen pixels
D. Staff age and office location in

**Correct answer: A.** Explanation: The lecture links information value to organizational goals and mentions decision-making time and increased profit as measures.

**13. What is the input component of an information system?**

A. Gathering and capturing raw data
B. Converting data into useful outputs
C. Producing documents and reports in
D. Using output to revise activities

**Correct answer: A.** Explanation: Input is the activity of gathering and capturing raw data.

**14. What is processing in an information system?**

A. Transforming data into useful outputs in
B. Gathering raw facts from sources in
C. Displaying final reports to users in
D. Using results to change earlier steps

**Correct answer: A.** Explanation: Processing converts or transforms data into useful outputs.

**15. What is output in an information system?**

A. Useful information such as reports in
B. Raw facts before any collection in
C. Rules for using a computer system
D. Feedback used to revise processing in

**Correct answer: A.** Explanation: Output is useful information, usually documents and reports.

**16. What is feedback in an information system?**

A. Output used to adjust system activities
B. Raw data captured from the environment
C. A computer program that governs hardware
D. A database containing organized facts in

**Correct answer: A.** Explanation: Feedback uses output to make changes to input or processing activities.

**17. Which sequence best represents the basic IS model?**

A. Input, processing, output, feedback
B. Output, hardware, people, database
C. Software, network, database, procedure
D. Feedback, profit, data, telecommunications

**Correct answer: A.** Explanation: The lecture's core model is input, processing, output, and feedback.

**18. Does every information system require a computer?**

A. No, a system can be manual
B. Yes, every system needs software in
C. Yes, all systems require networks in
D. No, systems cannot process data manually

**Correct answer: A.** Explanation: The lecture explains that information systems can be manual or computerized.

**19. Which is an example of a manual information system?**

A. Analyzing stock trends on graph paper
B. Automatically trading stocks with software in
C. Processing payroll through an application in
D. Sending transactions through a network in

**Correct answer: A.** Explanation: The lecture gives stock analysis on graph paper as a manual system example.

**20. What distinguishes a computerized information system?**

A. Software performs some processing tasks in
B. It never requires people or procedures
C. It cannot collect or store data
D. It always produces incorrect information in

**Correct answer: A.** Explanation: In a computerized system, software and computers perform processing tasks that might otherwise be manual.

## Part III — IS Components and CBIS

**21. What does CBIS stand for?**

A. Computer-based information system in
B. Computer business internet service
C. Centralized banking information software
D. Computerized business inspection service

**Correct answer: A.** Explanation: CBIS is the abbreviation for computer-based information system.

**22. Which is a component of a CBIS?**

A. Hardware in this
B. Marketing slogans in
C. Office furniture only
D. Customer preferences alone

**Correct answer: A.** Explanation: The six principal CBIS components are hardware, software, databases, telecommunications, people, and procedures.

**23. What is the role of hardware in a CBIS?**

A. Equipment for input, processing, and output
B. Programs that govern computer operation in
C. Organized facts stored for later use
D. Rules and methods for system use

**Correct answer: A.** Explanation: Hardware is the physical equipment used for input, processing, and output.

**24. What is software?**

A. Programs governing computer operation in
B. Physical devices used for input
C. Organized collections of business facts
D. People who maintain the system

**Correct answer: A.** Explanation: Software consists of programs that govern how a computer operates.

**25. What is a database?**

A. An organized collection of facts and information
B. A device used to display output in
C. A program that controls computer operations in
D. A set of policies for staff behavior

**Correct answer: A.** Explanation: The lecture defines a database as an organized collection of facts and information.

**26. What is telecommunications in a CBIS?**

A. Electronic transmission of communication signals in
B. A collection of stored business records
C. The physical equipment used for printing
D. Rules for accessing organizational systems in

**Correct answer: A.** Explanation: Telecommunications is the electronic transmission of signals for communication.

**27. What do networks do?**

A. Connect computers and equipment together in
B. Convert all software into hardware in
C. Replace databases with paper records in
D. Prevent every type of system failure

**Correct answer: A.** Explanation: Networks connect computers and equipment within buildings, across countries, and around the world.

**28. What is the Internet?**

A. The world's largest computer network in
B. A single computer used for databases
C. A software package for payroll in
D. A manual system for stock analysis

**Correct answer: A.** Explanation: The lecture describes the Internet as the world's largest computer network.

**29. What do people do in a CBIS?**

A. Manage, run, program, and maintain it
B. Only provide electricity to the hardware
C. Only store facts in the database
D. Replace all procedures with software in

**Correct answer: A.** Explanation: People operate, manage, program, and maintain the system.

**30. What are procedures in a CBIS?**

A. Strategies, policies, methods, and rules in
B. Hardware used for input and output
C. Programs that control the processor in
D. Electronic signals transmitted between devices in

**Correct answer: A.** Explanation: Procedures specify how a CBIS should be used, including policies and rules.

## Part IV — Business Information Systems and E-Commerce

**31. Why are people important in a CBIS?**

A. They operate and maintain its components in
B. They make software unnecessary in every case
C. They remove the need for procedures in
D. They guarantee all data are accurate in

**Correct answer: A.** Explanation: The lecture emphasizes that a CBIS depends on people as well as technology.

**32. Which business system handles routine transactions?**

A. Transaction processing system in
B. Decision support system in
C. Knowledge management system in
D. Virtual reality training system

**Correct answer: A.** Explanation: Transaction processing systems handle the many routine transactions at the base of the business IS pyramid.

**33. What is the role of an MIS?**

A. Provide information for management in
B. Process only customer payments in
C. Connect computers across the world
D. Create only virtual reality environments

**Correct answer: A.** Explanation: Management information systems provide information that supports management activities and decisions.

**34. What is the role of a DSS?**

A. Support decision making with information
B. Replace all business managers permanently
C. Process only routine sales transactions
D. Transmit signals between remote devices

**Correct answer: A.** Explanation: Decision support systems help decision makers analyze information for decisions.

**35. Where are knowledge management systems placed in the pyramid?**

A. Near the top of the pyramid
B. At the base with routine transactions
C. Outside the business system pyramid in
D. Below all hardware and software components

**Correct answer: A.** Explanation: The slide places knowledge management and special-purpose systems at the top of the business IS pyramid.

**36. What is e-commerce?**

A. Business transactions executed electronically in this
B. Any conversation held in a workplace
C. Only purchases made with cash in
D. A database used for employee payroll

**Correct answer: A.** Explanation: E-commerce is defined as business transactions executed electronically between parties.

**37. What does B2B mean in e-commerce?**

A. Business trading with another business
B. Business selling directly to consumers
C. Consumers trading with other consumers
D. Consumers requesting services from government

**Correct answer: A.** Explanation: B2B means business-to-business transactions.

**38. What does B2C mean in e-commerce?**

A. Business selling to a consumer
B. Business selling to another business
C. Consumers trading with other consumers
D. Government selling services to consumers

**Correct answer: A.** Explanation: B2C means business-to-consumer transactions.

**39. What does C2C mean in e-commerce?**

A. Consumers trading with other consumers
B. Business selling to a consumer
C. Business trading with another business
D. Government buying from a company

**Correct answer: A.** Explanation: C2C means consumer-to-consumer transactions.

**40. What is m-commerce?**

A. Commerce conducted through mobile wireless devices
B. Manual business conducted with paper records
C. Management reports produced by office software
D. A database shared by several departments

**Correct answer: A.** Explanation: M-commerce is e-commerce carried out on mobile, wireless devices.

## Part V — System Types and Business Applications

**41. Which is an example of e-commerce?**

A. Ordering products through an online store in
B. Writing stock trends on graph paper in
C. Entering employee hours on a paper form
D. Discussing a report in a meeting in

**Correct answer: A.** Explanation: An online purchase is an electronic business transaction.

**42. What does an enterprise system help support?**

A. Core operations across an organization in
B. Only one employee's personal calendar in
C. Only a single customer's web browser
D. Unrelated tasks without shared information in

**Correct answer: A.** Explanation: The business IS pyramid places enterprise systems among the systems supporting day-to-day business operations.

**43. Why are transaction systems at the pyramid base?**

A. They handle many routine business transactions in
B. They only provide advanced strategic forecasts in
C. They store only specialist expert knowledge in
D. They are used only for multimedia content

**Correct answer: A.** Explanation: The base systems run day-to-day business and process the largest volume of transactions.

**44. Which system is most associated with management reporting?**

A. Management information system in
B. Transaction processing system in
C. Mobile commerce system in
D. Manual stock analysis system

**Correct answer: A.** Explanation: MIS provides information and reports used by managers.

**45. Which system best supports complex decision analysis?**

A. Decision support system
B. Transaction processing system
C. Electronic commerce system
D. Manual filing system

**Correct answer: A.** Explanation: DSS supports decision-making by helping users analyze information.

**46. What is a specialized business information system?**

A. A system designed for a specific business purpose
B. A system that can only process payroll in
C. A network that only connects two computers in
D. A paper form used to collect raw facts

**Correct answer: A.** Explanation: The lecture includes specialized business information systems among the common business IS types.

**47. What is the main purpose of information systems in business?**

A. Support goals and improve performance in
B. Replace all employees in every department
C. Collect data without processing or use
D. Make decisions slower and more expensive

**Correct answer: A.** Explanation: The lecture notes that information systems can cut costs, increase profits, and support organizational objectives.

**48. Why should students in different majors study IS?**

A. Many professions use information systems in this
B. Only software developers use business systems in
C. IS knowledge is unrelated to most careers
D. Information systems are limited to research labs

**Correct answer: A.** Explanation: The lecture gives examples from management and biochemistry to show that IS knowledge is relevant across fields.

**49. How can an IS improve organizational performance?**

A. By improving productivity and decisions in
B. By preventing all business risks completely

C. By eliminating the need for data
D. By replacing every organizational objective in

**Correct answer: A.** Explanation: Information systems can improve productivity, decision-making, reduce costs, and increase profits.

**50. Which example is an information system mentioned in the lecture?**

A. Airline reservation system in
B. Standalone office chair in
C. Printed poster without data
D. Unconnected household light bulb

**Correct answer: A.** Explanation: The lecture lists ATMs, airline reservation systems, and course reservation systems as examples.

## Part VI — Input, Processing, Output, and Feedback

**51. What is the purpose of an ATM information system?**

A. Process account requests and provide results
B. Create software programs for developers in
C. Manage global internet routing protocols in
D. Produce multimedia animations for customers in

**Correct answer: A.** Explanation: An ATM collects input such as a card and PIN, processes a request, and outputs cash or a receipt.

**52. What does organizing sales by month and region do?**

A. Turns raw sales data into information
B. Converts a database into hardware in
C. Removes relationships between sales facts in
D. Makes all sales records unusable in

**Correct answer: A.** Explanation: Organizing data into meaningful relationships adds value and makes it useful as information.

**53. Which is a possible measure of information value?**

A. Reduced time needed for decisions in
B. Number of colors on a monitor
C. Physical size of the computer case
D. Length of the keyboard cable in

**Correct answer: A.** Explanation: The lecture identifies decision time as one measure of information value.

**54. What does the output of a payroll system include?**

A. Payslips and payroll reports in
B. Raw employee hours only in
C. Keyboard and monitor devices in
D. Rules for hiring new employees

**Correct answer: A.** Explanation: The lecture's payroll example identifies payslips and payroll reports as useful output.

**55. If a report reveals incorrect hours, what should happen?**

A. Correct input and process the data again
B. Ignore the report and keep the error
C. Delete every employee record permanently in this
D. Replace the database with a monitor in

**Correct answer: A.** Explanation: Feedback can lead to changes in input or processing, such as correcting hours and recalculating pay.

**56. What is the difference between data and information?**

A. Information is organized data with added value in
B. Data always contains more meaning than information in
C. Information is the physical computer equipment in this
D. Data is a set of rules for software

**Correct answer: A.** Explanation: Raw data become information when facts are organized to provide additional value.

**57. What is the transformation process?**

A. Applying knowledge to select and organize data
B. Buying hardware and connecting cables in this
C. Displaying data without changing its form in
D. Deleting facts before they are collected in

**Correct answer: A.** Explanation: The lecture describes transformation as selecting, organizing, and manipulating data.

**58. Which activity is an example of processing?**

A. Calculating total employee pay in this
B. Collecting a worker's hours in this
C. Printing a completed payslip in this
D. Using a report to correct inputs

**Correct answer: A.** Explanation: Calculating pay transforms the captured data into useful output.

**59. Which activity is an example of input?**

A. Recording hours worked by employees in
B. Calculating payroll totals in this lecture
C. Producing a monthly payroll report in
D. Using the report to correct records

**Correct answer: A.** Explanation: Recording employee hours is gathering and capturing raw data.

**60. Which activity is an example of output?**

A. Producing a payroll report
B. Recording hours worked in
C. Calculating deductions in this
D. Correcting an input value

**Correct answer: A.** Explanation: A payroll report is useful information produced by the system.

## Part VII — CBIS Components in Practice

**61. Which component stores organized facts?**

A. Database
B. Hardware
C. Telecommunications
D. Procedures

**Correct answer: A.** Explanation: A database stores an organized collection of facts and information.

**62. Which component includes computer programs?**

A. Software
B. Hardware
C. People
D. Networks

**Correct answer: A.** Explanation: Software consists of programs that govern computer operation.

**63. Which component includes keyboards and printers?**

A. Hardware
B. Software
C. Database
D. Procedures

**Correct answer: A.** Explanation: Keyboards and printers are physical equipment, so they are hardware.

**64. Which component defines rules for backups?**

A. Procedures
B. Telecommunications
C. Hardware
D. Database

**Correct answer: A.** Explanation: Backup rules are procedures: policies and methods for using a CBIS.

**65. Which component sends signals for communication?**

A. Telecommunications
B. Database
C. Software
D. People

**Correct answer: A.** Explanation: Telecommunications transmits electronic signals for communication.

**66. Which component links computers across locations?**

A. Networks
B. Procedures
C. Software
D. Database

**Correct answer: A.** Explanation: Networks connect computers and equipment in buildings, countries, and worldwide.

**67. Which business category includes transactions between companies?**

A. B2B e-commerce
B. B2C e-commerce
C. C2C e-commerce
D. M-commerce only

**Correct answer: A.** Explanation: B2B transactions occur between businesses.

**68. Which business category describes a company selling to individuals?**

A. B2C e-commerce in
B. B2B e-commerce in
C. C2C e-commerce in
D. Manual commerce only

**Correct answer: A.** Explanation: B2C describes business-to-consumer transactions.

**69. Which business category describes individuals selling to each other?**

A. C2C e-commerce in
B. B2B e-commerce in
C. B2C e-commerce in
D. Enterprise resource planning

**Correct answer: A.** Explanation: C2C describes consumer-to-consumer transactions.

**70. Which system type is closest to day-to-day operations?**

A. Transaction processing system
B. Knowledge management system
C. Decision support system
D. Special-purpose expert system

**Correct answer: A.** Explanation: Transaction processing systems support routine day-to-day business activities.

## Part VIII — E-Commerce Categories and Business Systems

**71. Which system type helps managers interpret summarized information?**

A. Management information system
B. Transaction processing system
C. Mobile commerce system
D. Telecommunications network in

**Correct answer: A.** Explanation: MIS supports managers with organized information and reports.

**72. Which system type is designed to support analytical decisions?**

A. Decision support system
B. Transaction processing system
C. Electronic commerce system
D. Database management procedure

**Correct answer: A.** Explanation: DSS is intended to support decision analysis.

**73. What does the business IS pyramid communicate?**

A. Different systems serve different business needs in
B. All systems perform exactly the same tasks
C. Only top-level systems process transactions in this
D. Business systems do not share information in

**Correct answer: A.** Explanation: The pyramid groups business systems by their roles, from routine transactions to management and specialized systems.

**74. Why do the CBIS components need to work together?**

A. Each component contributes to system operation
B. Hardware alone completes every system task
C. Procedures eliminate the need for people
D. Databases automatically replace all software in

**Correct answer: A.** Explanation: A CBIS is a combination of interdependent components; no single component is sufficient on its own.

**75. What is one benefit of information systems for a business?**

A. Lower costs and higher profits in
B. More manual work and slower decisions
C. Less access to useful information in
D. Removal of every need for planning

**Correct answer: A.** Explanation: The lecture states that information systems can cut costs and increase profits.

**76. Which example illustrates information systems in science?**

A. Using computer techniques for drug research
B. Drawing a stock chart by hand
C. Taking cash from a manual register
D. Filing paper forms in a cabinet

**Correct answer: A.** Explanation: The lecture uses a biochemistry graduate conducting drug research with computer techniques as an example.

**77. What should happen after feedback identifies an error?**

A. Revise input or processing activities in
B. Ignore the error and publish output
C. Remove all data from the database
D. Stop using the information system forever

**Correct answer: A.** Explanation: Feedback is output used to make changes to input or processing.

**78. Which statement about manual systems is correct?**

A. People can process data without computers in
B. Manual systems cannot produce information in this
C. Manual systems do not use input data
D. Manual systems always require mobile devices in

**Correct answer: A.** Explanation: The lecture's graph-paper stock analysis example demonstrates a manual information system.

**79. Which statement about e-commerce is correct?**

A. It involves electronic business transactions in this
B. It only refers to mobile phone calls
C. It excludes transactions between companies in this
D. It always requires a face-to-face meeting in

**Correct answer: A.** Explanation: E-commerce covers business transactions executed electronically between different parties.

**80. Which statement about m-commerce is correct?**

A. It uses mobile wireless devices for commerce
B. It uses only paper forms for transactions
C. It excludes wireless networks from business in
D. It refers only to management reporting in

**Correct answer: A.** Explanation: M-commerce carries out commerce through mobile, wireless devices.

## Part IX — System Integration and Organizational Value

**81. What is a key role of information in decisions?**

A. Help decision makers achieve organizational goals in
B. Increase the number of raw facts only
C. Remove the need for any judgment in
D. Guarantee every decision is correct in this

**Correct answer: A.** Explanation: Information is valuable when it helps decision makers achieve organizational goals.

**82. What does a computer-based IS combine?**

A. Technology, data, people, and procedures
B. Only hardware and electrical power
C. Only software and internet connections
D. Only databases and printed reports

**Correct answer: A.** Explanation: A CBIS combines hardware, software, databases, telecommunications, people, and procedures.

**83. What is the main idea of Lecture 1?**

A. Systems transform data into useful information in
B. All information systems must be online in
C. Only managers use information systems in this
D. Data and information mean exactly the same

**Correct answer: A.** Explanation: The lecture introduces information systems through the transformation of data into information, system components, business types, and development concepts.

**84. What is one example of a course reservation system?**

A. A system used to register for classes
B. A device used to print photographs in
C. A program designed only for video editing
D. A network cable connecting two computers in

**Correct answer: A.** Explanation: The lecture lists course reservation systems as examples of information systems.

**85. What does a transaction processing system primarily handle?**

A. Routine business transactions and records
B. Long-term ethical debates and policies
C. Only advanced scientific simulations in
D. Only employee ergonomic assessments in

**Correct answer: A.** Explanation: Transaction processing systems support routine day-to-day business operations.

**86. What does an information system distribute?**

A. Data and information to relevant users
B. Only hardware to different departments in
C. Only software licenses to customers in
D. Only cables between network devices in

**Correct answer: A.** Explanation: The lecture defines an IS as collecting, manipulating, storing, and distributing data and information.

**87. What happens when raw facts remain unorganized?**

A. They usually have limited value in
B. They automatically become useful knowledge in
C. They always support better decisions in
D. They replace the need for processing

**Correct answer: A.** Explanation: The lecture explains that raw data have limited value until they are organized into information.

**88. Which action best describes organizing data?**

A. Arranging facts and defining their relationships
B. Deleting all facts from the database
C. Replacing reports with computer hardware in
D. Transmitting signals without any context in

**Correct answer: A.** Explanation: Organizing arranges facts and defines relationships, creating more useful information.

**89. What is an example of manipulating data?**

A. Calculating totals and summarizing records in
B. Collecting raw facts from a form
C. Printing a report for a manager
D. Connecting computers through a network in

**Correct answer: A.** Explanation: The transformation process includes manipulating data through calculations, sorting, and summarizing.

**90. Which statement about information value is correct?**

A. Its value depends on helping achieve goals
B. Its value depends only on file size
C. Its value increases with every extra field
D. Its value is unrelated to decision making

**Correct answer: A.** Explanation: Information value is linked to how it helps decision makers achieve organizational goals.

## Part X — Review and Application

**91. What does a computer-based system use to operate?**

A. Hardware, software, data, people, procedures
B. Only computers and power supplies
C. Only information and printed reports
D. Only users and communication signals

**Correct answer: A.** Explanation: A CBIS combines six components: hardware, software, databases, telecommunications, people, and procedures.

**92. Which is a procedure in a business system?**

A. A rule specifying who may access data
B. A physical device used for data entry
C. A stored collection of customer facts in
D. A program that calculates employee pay in

**Correct answer: A.** Explanation: Procedures include strategies, policies, methods, and rules for using a CBIS.

**93. What is a key difference between input and output?**

A. Input captures data; output presents results
B. Input presents reports; output captures facts
C. Input stores software; output connects networks
D. Input manages people; output defines procedures

**Correct answer: A.** Explanation: Input gathers raw data, while output produces useful information such as documents and reports.

**94. Which system is an example of e-commerce?**

A. A company ordering parts from a supplier online
B. A student arranging notes on paper in this
C. A manager drawing trends on graph paper in
D. A technician replacing a keyboard cable in this

**Correct answer: A.** Explanation: The lecture describes companies trading electronically with other companies as B2B e-commerce.

**95. Which category best describes a consumer selling to another consumer online?**

A. Consumer-to-consumer electronic commerce in
B. Business-to-consumer electronic commerce in
C. Business-to-business electronic commerce in
D. Management information system reporting

**Correct answer: A.** Explanation: C2C means consumer-to-consumer electronic transactions.

**96. Which is the best example of mobile commerce?**

A. Buying a product using a wireless phone
B. Filing a printed report in a cabinet
C. Drawing a chart using a pencil in
D. Calculating totals on graph paper in this

**Correct answer: A.** Explanation: M-commerce is commerce carried out using mobile, wireless devices.

**97. What does a management information system support?**

A. Management activities with organized information in
B. Only wireless communication between devices in
C. Only consumer purchases through mobile phones
D. Only physical input and output equipment

**Correct answer: A.** Explanation: MIS provides information that supports management activities.

**98. What does a decision support system help users do?**

A. Analyze information for making decisions
B. Capture every routine transaction only
C. Transmit signals across a network

D. Replace databases with printed forms

**Correct answer: A.** Explanation: DSS is intended to support decision making through analysis of information.

**99. Why must CBIS components fit together?**

A. The system depends on their combined functions
B. Any single component can perform every task
C. People and procedures are never necessary in
D. Hardware automatically creates all useful data in

**Correct answer: A.** Explanation: The lecture depicts the six components as interlocking pieces, emphasizing that they work together.

**100. What is the central transformation described in Lecture 1?**

A. Raw data are processed into useful information
B. Hardware is transformed into network cables in
C. People are replaced by computer procedures in
D. Business goals are replaced by raw facts

**Correct answer: A.** Explanation: The lecture's core theme is that systems process data to produce useful information.
