100 Multiple-Choice Questions

Security, Privacy and Ethical Issues in Information Systems

Part I — Computer Waste, Mistakes, and Policy

1. What is computer waste?

A. Inappropriate use of computing resources
B. Incorrect output from computer processing
C. Unauthorized access to computer systems
D. Unethical collection of personal information

Correct answer: A. Explanation: Computer waste means using computer technology or resources in an inappropriate or inefficient way, such as unnecessary printing or underused systems.

2. Which issue is a typical example of computer waste?

A. Printing reports nobody reads here
B. Entering an incorrect customer address
C. Deleting a file by mistake
D. Using a stolen password here

Correct answer: A. Explanation: Printing unread reports wastes paper, equipment, and staff time; it is not primarily a data error or a crime.

3. What is the main root cause of computer waste?

A. Poor management of information resources
B. Insufficient screen resolution settings here
C. Excessive network encryption strength here
D. Frequent changes in employee names

Correct answer: A. Explanation: The chapter attributes waste mainly to improper management of information systems and resources.

4. What best describes a computer mistake?

A. An error producing incorrect output
B. A policy protecting personal privacy
C. A method encrypting a message
D. A tool detecting network intrusions

Correct answer: A. Explanation: Computer mistakes are errors or failures that make system output incorrect or not useful.

5. Why can computer mistakes cause extensive damage?

A. Processing speed can multiply errors quickly
B. Computers always remove invalid information here
C. Programs prevent all human mistakes here
D. Networks automatically correct every record here

Correct answer: A. Explanation: Fast processing can spread or multiply an unnoticed error before people detect it.

6. Which factor can cause computer mistakes?

A. Unclear expectations and feedback here
B. Strong passwords and encryption here
C. Accurate records and validation here
D. Regular audits and staff training

Correct answer: A. Explanation: Unclear expectations and lack of feedback are listed causes, along with program errors and wrong data entry.

7. Which is a data-entry or capture error?

A. Typing the wrong customer amount
B. Installing a security software patch
C. Encrypting a message before sending
D. Reviewing a privacy policy annually

Correct answer: A. Explanation: Entering an incorrect value is a data-entry error.

8. Which action illustrates a file-handling mistake?

A. Overwriting a newer file accidentally
B. Updating antivirus definitions automatically here
C. Restricting access by staff role
D. Removing an obsolete web link

Correct answer: A. Explanation: Accidentally replacing a current file with an older one is a file-handling error.

9. Which planning failure can cause system mistakes?

A. Insufficient capacity for website traffic
B. Frequent checks of data accuracy
C. Documented changes to critical tables
D. Regular testing of backup copies

Correct answer: A. Explanation: A website with too little computing capacity may fail when traffic exceeds what it can handle.

10. Which is an environmental risk to plan for?

A. Power or humidity problems
B. Incorrect social media passwords
C. Outdated employee job titles
D. Unclear report descriptions here

Correct answer: A. Explanation: The chapter specifically identifies electrical and humidity problems as environmental issues requiring planning.

Part II — Policy Cycle and Computer Crime

11. What is the first step in the four-step policy cycle?

A. Establish rules and policies here
B. Monitor results against goals here
C. Review policies for new risks
D. Implement controls and training here

Correct answer: A. Explanation: The cycle begins by establishing rules for buying, using, and disposing of systems.

12. What is the second step in the policy cycle?

A. Implement controls and training here
B. Establish rules and policies here
C. Monitor results against goals here
D. Review policies for new risks

Correct answer: A. Explanation: Implementation puts policies into practice through controls, manuals, validation, and training.

13. What is the third step in the policy cycle?

A. Monitor results against goals here

B. Review policies for new risks
C. Establish rules and policies here
D. Implement controls and training here

Correct answer: A. Explanation: Monitoring checks compliance and measures performance, often through internal audits.

14. What is the fourth step in the policy cycle?

A. Review policies for current needs
B. Monitor results against goals here
C. Implement controls and training here
D. Establish rules and policies here

Correct answer: A. Explanation: Review asks whether policies still cover current activities, new risks, contingencies, and disasters.

15. Why should organizations validate data input?

A. To catch unreasonable values early
B. To make every report longer
C. To remove all user training
D. To allow unrestricted system changes

Correct answer: A. Explanation: Input validation can block invalid or unreasonable values before they cause downstream errors.

16. What lesson follows from the Valparaiso property-value case?

A. Validate inputs before forecasting revenue here
B. Trust every value entered by staff
C. Remove all checks from data entry
D. Use estimates instead of recorded data

Correct answer: A. Explanation: A wrongly entered property value distorted tax forecasts; validation and early error detection could help prevent such harm.

17. What contributed to the Patriot missile tragedy described?

A. Radar problems combined with human error
B. A phishing email and stolen password
C. A worm and outdated web links
D. A privacy policy and data breach

Correct answer: A. Explanation: The presentation says experts attributed the incident to radar problems combined with human error.

18. Why was Admiral's Facebook insurance proposal blocked?

A. Platform terms restricted eligibility decisions here
B. The insurer lacked any customer permission
C. The posts contained no written sentences
D. The algorithm required iris scan data

Correct answer: A. Explanation: Facebook refused the proposal because its terms barred using its data to make eligibility decisions.

19. What is computer crime?

A. Illegal activity involving computer systems here
B. Waste caused by unused printouts here
C. A posture problem at a workstation
D. A lawful review of public records

Correct answer: A. Explanation: The chapter discusses illegal access, data manipulation, malware, theft, piracy, and computer-enabled scams.

20. What is identity theft?

A. Using another person's identity details here
B. Deleting obsolete links from websites here
C. Encrypting a message for a recipient
D. Monitoring server alerts for intrusions here

Correct answer: A. Explanation: Identity thieves use personal details to open accounts, borrow money, or obtain documents in another person's name.

Part III — Identity Theft and Attacker Profiles

21. What is social engineering?

A. Tricking people into revealing information here
B. Watching network traffic for anomalies here
C. Encrypting data with a public key
D. Copying files between approved folders here

Correct answer: A. Explanation: Social engineering manipulates people into disclosing passwords or other sensitive information.

22. What is shoulder surfing?

A. Watching someone enter a PIN
B. Searching code for program errors
C. Scanning files for known malware
D. Reviewing employee roles for access

Correct answer: A. Explanation: Shoulder surfing means observing a person typing a PIN or entering information.

23. Why should missing bills be investigated?

A. A thief may have changed the address
B. The antivirus definitions may be outdated here
C. A public key may have expired here
D. A workstation may need ergonomic support here

Correct answer: A. Explanation: Identity thieves may redirect account mail and accumulate charges before the victim notices.

24. Which action helps reduce identity-theft risk?

A. Shred sensitive documents before disposal
B. Share passwords with trusted callers
C. Ignore bills that never arrive
D. Reply to unsolicited data requests

Correct answer: A. Explanation: Shredding bills and statements makes it harder for thieves to recover personal details from rubbish.

25. Which attacker targets infrastructure for political aims?

A. A cyberterrorist seeking political influence here
B. A script kiddie seeking simple experiments
C. An insider seeking role-based access here
D. A software pirate seeking licensed programs

Correct answer: A. Explanation: Cyberterrorists seek political or social objectives and may target energy, banking, water, or emergency services.

26. What is a cracker in this chapter?

A. A person seeking unauthorized system access
B. A user validating ordinary data entries
C. A manager reviewing privacy notices here

D. A specialist designing ergonomic keyboards here

Correct answer: A. Explanation: A cracker is described as a computer-savvy person attempting unauthorized access, sometimes to steal or damage data.

27. What characterizes a script kiddie?

A. Using ready-made scripts with limited skill
B. Attacking infrastructure for political goals here
C. Abusing trusted access as an employee
D. Collecting fingerprints for identity checks here

Correct answer: A. Explanation: Script kiddies have limited technical skill and use downloaded scripts to automate break-ins.

28. Who is an insider threat?

A. An employee compromising company systems here
B. A stranger viewing a public website
C. A customer correcting personal records here
D. A vendor issuing a software license

Correct answer: A. Explanation: An insider may be an employee acting alone or with outsiders to compromise systems.

29. What is malware?

A. Software designed to cause harmful activity
B. A policy for handling personal data
C. A process for reviewing system capacity
D. A method for improving workstation posture

Correct answer: A. Explanation: Malware is the broad term used for malicious programs such as viruses, worms, Trojans, and spyware.

30. How does a computer virus typically spread?

A. It attaches to files and replicates here
B. It only monitors employee break times here
C. It encrypts messages using public keys here
D. It requires a person to forward alerts

Correct answer: A. Explanation: A virus attaches to files or discs and replicates, often without the user's knowledge.

Part IV — Malware and Antivirus

31. How does a worm differ from a virus?

A. It spreads across networks independently in practice
B. It always disguises itself as useful software
C. It only activates at a specified time
D. It merely warns users about fake threats

Correct answer: A. Explanation: A worm is standalone and copies itself to other computers on a network without attaching to another file.

32. What is a Trojan horse?

A. Useful-looking software with hidden harmful behavior in practice
B. A self-replicating program spreading through networks in practice
C. A fake alert asking users to forward warnings
D. A stored record used to verify fingerprints here

Correct answer: A. Explanation: A Trojan disguises itself as useful software but performs an unexpected or harmful action.

33. What is a logic bomb?

A. Malicious code triggered by a condition
B. A program copying itself between computers
C. A tool measuring a user's fingerprint
D. A policy governing software purchase approvals

Correct answer: A. Explanation: A logic bomb activates when a specified date, time, or keystroke condition is met.

34. What does spyware do?

A. Secretly collects information about users in practice
B. Replicates by attaching itself to files here
C. Blocks all unauthorized physical server access here
D. Checks whether a website has enough capacity

Correct answer: A. Explanation: Spyware secretly records personal information such as passwords, card details, or browsing habits.

35. What is a virus variant?

A. A modified virus that may evade detection
B. A worm that never crosses a network
C. A fake bank page used in phishing
D. A biometric record stored for comparison here

Correct answer: A. Explanation: A variant is a modified virus; substantial changes can help it evade antivirus detection.

36. What is a hoax virus?

A. A fake warning encouraging harmful actions here
B. A genuine virus attaching to a document
C. A Trojan activating at a chosen time
D. A worm copying itself across networks here

Correct answer: A. Explanation: A hoax tricks users into panic-driven actions, such as deleting important files or forwarding false warnings.

37. Why should antivirus software update frequently?

A. New definitions help detect emerging threats
B. Updates prevent every possible human error
C. Updates remove the need for backups
D. New definitions make passwords unnecessary here

Correct answer: A. Explanation: Frequent updates help antivirus tools recognize newly identified viruses and threats.

38. What should users do before opening suspicious attachments?

A. Avoid opening them and seek guidance
B. Forward them to every colleague immediately
C. Disable antivirus to inspect them faster
D. Save them permanently for future reference

Correct answer: A. Explanation: The chapter advises never opening suspicious attachments and sending alerts to the help desk or security team.

39. Why scan removable media before use?

A. It may carry infected files here
B. It always contains outdated privacy policies
C. It automatically changes user permissions here
D. It prevents all equipment theft here

Correct answer: A. Explanation: Flash drives and other removable media can transfer malware to a computer.

40. What is a botnet?

A. A network of hijacked computers here
B. A list of authorized employee roles
C. A system for encrypting private messages
D. A database of public privacy policies

Correct answer: A. Explanation: A botnet is a group of compromised computers controlled or used without their owners' knowledge.

Part V — Piracy, Phishing, and Crime Prevention

41. What is software piracy?

A. Illegal duplication or distribution of software
B. Authorized installation under license terms here
C. Encryption of software before transmission here
D. Updating software from a trusted vendor

Correct answer: A. Explanation: Software piracy involves illegally copying or distributing software protected by copyright and license terms.

42. What does a software buyer usually receive?

A. A license to use the software
B. Ownership of all source code here
C. Permission to resell unlimited copies here
D. Automatic rights to remove copyright here

Correct answer: A. Explanation: The chapter emphasizes that buyers generally receive a license to use software, not ownership of the software itself.

43. What is phishing?

A. A deceptive message leading to a fake site
B. A sensor detecting unusual network behavior in practice
C. A method of encrypting a private message here
D. A policy for reviewing employee posture in practice

Correct answer: A. Explanation: Phishing lures people to fake websites to steal information such as card numbers and personal details.

44. Which clue should make a user suspicious of phishing?

A. A pressured request for bank details here
B. A routine update from a verified portal
C. A documented policy with clear terms here
D. A report showing its covered date range

Correct answer: A. Explanation: Unexpected requests for sensitive data, especially under pressure, should be treated cautiously and independently verified.

45. What is a shill in an online scam?

A. A paid person exaggerating likely earnings
B. A specialist reviewing security audit trails
C. A user correcting inaccurate personal data
D. A program validating submitted form fields

Correct answer: A. Explanation: A shill is paid to make a company or scheme appear successful by exaggerating earnings or benefits.

46. Which computer-crime method changes stored records?

A. Altering data files without authorization here
B. Reviewing audit reports against goals here
C. Encrypting messages for intended recipients here
D. Removing obsolete links from a website

Correct answer: A. Explanation: Changing a student's grade or another stored record is an example of altering data files.

47. Which crime method misuses valid output?

A. Stealing customer printouts from bins in practice
B. Installing patches on corporate servers in practice
C. Using a fingerprint to unlock a device
D. Checking a report's date range in practice

Correct answer: A. Explanation: Discarded customer printouts may contain sensitive information and can be stolen and misused.

48. What is one state-level defence against computer crime?

A. Laws and specialist enforcement bodies here
B. Staff posture training and adjustable chairs
C. Role-based permissions for each application here
D. Automatic scanning of removable media here

Correct answer: A. Explanation: The state contributes through computer-crime laws, data-protection laws, and specialist police or public bodies.

49. What does encryption do?

A. Transforms messages into unreadable coded text
B. Records every keystroke made by staff
C. Measures physical traits against stored records
D. Monitors server traffic for unusual patterns

Correct answer: A. Explanation: Encryption converts a message into a form that only intended recipients can understand or decrypt.

50. In public-key encryption, which key encrypts a message to a receiver?

A. The receiver's publicly available key
B. The sender's privately guarded key
C. The receiver's secretly stored key
D. The sender's biometric identity record

Correct answer: A. Explanation: Anyone can use the receiver's public key to encrypt a message intended for that receiver.

Part VI — Encryption, Biometrics, and Access

51. Which key decrypts a message sent using the receiver's public key?

A. The receiver's private secret key
B. The sender's public shared key
C. The receiver's public shared key
D. The sender's publicly listed key

Correct answer: A. Explanation: The receiver's private key is kept secret and is used to decrypt the message.

52. What does a longer encryption key generally provide?

A. Greater strength against code breaking here
B. Automatic protection from phishing emails here
C. Faster deletion of stored personal data

D. Complete prevention of insider misconduct here

Correct answer: A. Explanation: The chapter explains that longer keys generally make code breaking require more computing power.

53. What is PKI used for?

A. Secure data exchange and authentication here
B. Measuring workstation comfort and safety here
C. Finding fake virus alerts in email
D. Removing outdated links from websites here

Correct answer: A. Explanation: Public-key infrastructure supports secure exchanges and authentication using a pair of keys obtained through a trusted authority.

54. What is biometrics?

A. Matching physical or behavioral traits to records
B. Matching passwords to public privacy notices here
C. Matching websites to traffic capacity estimates here
D. Matching software licenses to purchase receipts here

Correct answer: A. Explanation: Biometrics compares a person's physical or behavioral trait with a stored record.

55. Which biometric method is described as most popular?

A. Fingerprint recognition balancing cost and effectiveness
B. Iris scanning offering maximum low-cost convenience
C. Retina scanning requiring minimal equipment here
D. Face recognition requiring no stored reference

Correct answer: A. Explanation: The slide identifies fingerprints as the most popular option because they balance price and effectiveness.

56. Which biometric option is described as most accurate and costly?

A. Iris and retina scanning systems
B. Fingerprint scanning at standard terminals
C. Face recognition using ordinary cameras
D. Password entry with role-based permissions

Correct answer: A. Explanation: The chapter characterizes iris and retina scans as highly accurate but more expensive and equipment-intensive.

57. Why use role-based access lists?

A. Permissions follow job roles, not individuals
B. Permissions remain after every job change
C. Every employee receives identical system access
D. Users can bypass all access restrictions

Correct answer: A. Explanation: Role-based access ties permissions to roles, reducing the accumulation of obsolete privileges after job changes.

58. What does an intrusion detection system do?

A. Flags suspicious activity and alerts staff
B. Encrypts every message sent over networks
C. Automatically grants access to new employees
D. Replaces the need for security procedures

Correct answer: A. Explanation: An IDS monitors systems or networks for signs of possible intrusion and notifies security staff.

59. What is a common weakness of intrusion detection systems?

A. Frequent false alarms can distract staff here
B. They always decrypt every private message here

C. They prevent all attacks before entry here
D. They eliminate the need for audit trails

Correct answer: A. Explanation: IDS tools can generate false alarms, and staff must distinguish real incidents from noise.

60. What lesson comes from the SQL Slammer case?

A. Alerts need urgent handling and response
B. Unmonitored servers are always harmless here
C. Email alerts should never be investigated
D. Intrusion detection replaces all security layers

Correct answer: A. Explanation: The worm was detected, but the alert was missed because it was not marked urgent; delayed response allowed major disruption.

Part VII — Intrusion Detection and Security Controls

61. What is a managed security service provider?

A. A firm outsourcing security monitoring and maintenance
B. A government office publishing public information here
C. A vendor selling unauthorized software copies here
D. A tool comparing privacy policies with preferences

Correct answer: A. Explanation: MSSPs provide outsourced monitoring, management, and maintenance of security hardware and software.

62. Which is a recommended hacker-defense measure?

A. Install current patches and audit systems
B. Keep guest accounts open without passwords
C. Allow unrestricted physical access to servers
D. Disable antivirus on employee computers here

Correct answer: A. Explanation: The defense checklist includes current patches, restricted access, updated antivirus, audits, and tested backups.

63. Why restrict physical access to servers?

A. To reduce unauthorized access and damage here
B. To make public-key encryption more complex here
C. To increase the number of false alarms
D. To allow every user to change programs

Correct answer: A. Explanation: Physical controls help prevent unauthorized people from tampering with or accessing critical systems.

64. Why maintain and test backups?

A. To restore critical data after failures here
B. To guarantee that phishing messages are genuine
C. To grant every employee the same permissions
D. To replace all software update procedures here

Correct answer: A. Explanation: Frequent, tested backups support recovery after data loss, malware, or other system failures.

65. Why are insiders a serious security concern?

A. They may already have legitimate access here
B. They cannot access any company information here
C. They are always blocked by the firewall
D. They only use publicly available data here

Correct answer: A. Explanation: Firewalls protect network boundaries but do not eliminate risks from employees who already have access.

66. Which is a privacy concern at work?

A. Software tracking keystrokes and breaks
B. Software updating virus definitions automatically
C. Software validating numerical data entries
D. Software measuring screen brightness levels

Correct answer: A. Explanation: Employee-monitoring tools may log keystrokes and breaks, raising concerns about dignity and privacy.

67. Why can workplace email create privacy concerns?

A. Employers may read messages on their servers
B. Emails are always encrypted from every administrator
C. Employees own every server backup automatically here
D. Messages disappear permanently after being read here

Correct answer: A. Explanation: The presentation notes that companies may read data on their servers and retain email for years.

68. What is one privacy risk of Internet browsing?

A. Visits can be combined into user profiles
B. Every visit automatically deletes stored records here
C. Websites cannot collect any browsing information here
D. Browsers prevent all tracking by default here

Correct answer: A. Explanation: Browsing activity can be captured and combined to build profiles, creating privacy and marketing concerns.

69. What does P3P help a browser do?

A. Compare site privacy policies with preferences here
B. Encrypt every website's entire database in practice
C. Delete all public records from search engines
D. Detect every malicious program on a device

Correct answer: A. Explanation: The Platform for Privacy Preferences was described as allowing browsers to compare a site's policy with a user's preferences.

70. What does the fairness principle of knowledge ask?

A. Whether people know what data is stored
B. Whether all collected data is encrypted twice
C. Whether every employee has administrator access here
D. Whether websites receive unlimited storage capacity here

Correct answer: A. Explanation: Knowledge concerns whether people are informed about the personal data an organization stores about them.

Part VIII — Privacy and Fair Data Use

71. What does the fairness principle of control ask?

A. Whether people can correct inaccurate records here
B. Whether companies can collect data without limits
C. Whether employees can read every colleague's email
D. Whether users can install any software freely

Correct answer: A. Explanation: Control concerns people's ability to correct errors in corporate databases.

72. What does notice mean in fair data use?

A. Informing people before data gets reused
B. Deleting all data immediately after collection
C. Giving every user the same password
D. Publishing private records for public inspection

Correct answer: A. Explanation: Notice concerns informing people before personal data is used for a new purpose.

73. What does consent mean in fair data use?

A. Seeking agreement before selling or reusing data
B. Automatically sharing data with every partner here
C. Keeping collection purposes secret from users here
D. Preventing people from correcting their records here

Correct answer: A. Explanation: Consent concerns whether people must agree before their data is sold or reused for other purposes.

74. What does GDPR purpose limitation require?

A. Use data only for specified purposes here
B. Collect every available detail just in case
C. Keep all records permanently for convenience here
D. Share personal data without informing anyone here

Correct answer: A. Explanation: Purpose limitation means collecting and using data for specific, publicly known purposes rather than gathering it just in case.

75. What does GDPR data minimization require?

A. Collect no more data than necessary here
B. Collect every possible field from each user
C. Keep duplicate records in every database here
D. Store data indefinitely after its purpose ends

Correct answer: A. Explanation: Data minimization means organizations should collect only the data needed for the stated purpose.

76. What does GDPR accuracy require?

A. Keep personal records correct and current here
B. Store data only on paper documents here
C. Keep every record after it becomes obsolete
D. Make all data available to the public

Correct answer: A. Explanation: Accuracy requires that personal data be accurate and kept up to date.

77. What does GDPR storage limitation require?

A. Delete data when it is no longer needed
B. Retain every record for unlimited periods in practice
C. Reuse data for any future business purpose here
D. Copy all data to every partner system here

Correct answer: A. Explanation: Storage limitation requires proper deletion when the data is no longer needed for its purpose.

78. What does GDPR integrity and confidentiality require?

A. Keep personal data secure and protected here
B. Publish personal data for public convenience here
C. Allow every worker to alter all records
D. Collect extra data without a stated purpose

Correct answer: A. Explanation: Integrity and confidentiality concern secure handling and protection against unauthorized access or disclosure.

79. What does GDPR accountability mean in the slides?

A. Organizations must answer for data handling here
B. Individuals must publish all private details here
C. Companies can ignore their stated purposes here
D. Data accuracy is optional for large firms

Correct answer: A. Explanation: Accountability means organizations are responsible for compliant data handling and individuals may know, see, correct, or delete their data.

80. What is the right to be forgotten described as?

A. Removing certain links from search results here
B. Erasing every copy of original online content
C. Blocking all search engines from operating here
D. Deleting all public information about organizations here

Correct answer: A. Explanation: The presentation explains that certain links may be removed from search results, while the underlying content may remain online.

Part IX — Data Protection Laws and Workplace Health

81. What is the purpose of the Freedom of Information Act example?

A. Allow requests for public-body information in practice
B. Permit unrestricted access to private databases here
C. Require businesses to delete all customer records
D. Make every computer intrusion legally acceptable here

Correct answer: A. Explanation: The act allows people to request information held by public bodies, subject to exceptions.

82. What does the Computer Misuse Act example address?

A. Unauthorized access and computer-related crime here
B. Workstation posture and repetitive strain injuries
C. Employee rights to disconnect from email
D. The accuracy of corporate customer records

Correct answer: A. Explanation: The chapter presents the UK Computer Misuse Act as criminalizing unauthorized access and other computer misuse.

83. What can a disclosure notice under the cited UK law require?

A. Handing over specified device passwords here
B. Publishing every company email publicly here
C. Deleting every personal record immediately here
D. Installing fingerprint scanners on all devices

Correct answer: A. Explanation: The presentation describes disclosure notices that can require people to provide passwords, with penalties for refusal in specified circumstances.

84. What is occupational stress linked to in the chapter?

A. Job insecurity and loss of control
B. Strong encryption and updated antivirus here
C. Accurate records and clear report titles
D. Adjustable chairs and supported forearms here

Correct answer: A. Explanation: Stress may arise from fear of job loss, loss of control, perceived incompetence, or demotion.

85. What is repetitive strain injury associated with?

A. Repeated movements and awkward posture
B. Public-key exchange and longer encryption
C. Public information requests and disclosures

D. Software licenses and copyright restrictions

Correct answer: A. Explanation: Repetitive typing and poor posture can contribute to strain injuries, including carpal tunnel syndrome.

86. Which symptom is associated with carpal tunnel syndrome?

A. Wrist tingling and reduced grip strength
B. Improved posture and stronger leg muscles
C. Faster typing with fewer data errors
D. Clearer vision and reduced screen glare

Correct answer: A. Explanation: The chapter lists pain, tingling, numbness, and difficulty gripping as symptoms.

87. What is ergonomics?

A. Designing work to improve safety and comfort
B. Designing malware to evade antivirus detection here
C. Designing scams to steal personal information here
D. Designing laws to restrict public information here

Correct answer: A. Explanation: Ergonomics designs equipment and work systems to maximize safety, comfort, and efficiency for people.

88. Where should the top of a monitor be positioned?

A. At or just below eye level
B. Well above the user's head level
C. Near the user's waist level here
D. Directly behind the user's chair here

Correct answer: A. Explanation: The slide recommends positioning the top of the monitor at or just below eye level.

89. How should wrists and hands align when typing?

A. In line with the forearms
B. Bent sharply toward the keyboard
C. Raised above the shoulder level
D. Resting against the monitor frame

Correct answer: A. Explanation: Neutral wrist alignment reduces strain; the slide says wrists and hands should remain in line with forearms.

90. Which workstation setup supports the lower back?

A. A chair providing lower-back support in this chapter
B. A stool without any back support in practice
C. A desk forcing the user to lean forward
D. A screen positioned below knee level in practice

Correct answer: A. Explanation: The ergonomics checklist recommends supporting the lower back.

Part X — Ergonomics and Professional Ethics

91. Which habit supports computer-work health?

A. Take breaks, stand, and stretch here
B. Ignore pain until work is finished
C. Keep wrists bent during every task
D. Avoid adjusting the chair or screen

Correct answer: A. Explanation: Regular breaks, standing, and stretching can reduce strain; the chapter says not to ignore pain.

92. What is one potential positive effect of information systems on work?

A. More careers and accessibility for disabled people
B. Elimination of every workplace stressor in practice
C. Removal of every need for human judgment
D. Guaranteed privacy for all online activity here

Correct answer: A. Explanation: The chapter notes that computers create careers, expand markets, speed tasks, and can improve participation for people with disabilities.

93. What is a code of ethics?

A. Principles and values guiding professional behavior here
B. A program that copies itself across networks
C. A legal notice requiring password disclosure here
D. A tool that tracks employee keystrokes here

Correct answer: A. Explanation: A code of ethics states the core principles and values that guide a profession.

94. Why is legality not enough to judge conduct?

A. Some legal actions can still be unethical
B. Every ethical action is automatically illegal here
C. Laws cover every possible moral question here
D. Professional codes replace all legal obligations here

Correct answer: A. Explanation: The chapter stresses that laws do not fully define right and wrong; conduct may be legal but still unethical.

95. Which organization is associated with an IS professional code of ethics?

A. British Computer Society professional code
B. Business Software Alliance privacy database
C. Kaspersky Lab intrusion response office
D. European Union biometric standards committee

Correct answer: A. Explanation: The presentation identifies the British Computer Society as having a code of ethics and professional conduct for IS professionals.

96. What is COBIT associated with in the chapter?

A. IT governance with ethical considerations in this chapter
B. A malware family spreading through email in practice
C. A biometric technique identifying users in this chapter
D. A law requiring public bodies to disclose data

Correct answer: A. Explanation: ISACA's COBIT framework incorporates IT governance and ethics and can help organizations meet reporting requirements.

97. What is the chapter's overall message about information systems?

A. Protect systems, data, health, and people in practice
B. Prioritize speed over every safety concern in practice
C. Treat legal compliance as the only ethical test
D. Collect all available data for future use here

Correct answer: A. Explanation: The summary connects policies, crime prevention, privacy, ergonomics, and ethical conduct, emphasizing that people are central to information systems.

98. What is one purpose of internal security audits?

A. Check compliance with established security goals
B. Replace training for every system user
C. Make public every private customer record
D. Allow staff to ignore policy changes

Correct answer: A. Explanation: Internal audits compare actual practices and outcomes with organizational goals and help identify weaknesses.

99. Why should privacy policies be clear to users?

A. They explain how personal data is handled here
B. They guarantee that no data is ever collected
C. They allow companies to ignore user preferences here
D. They replace every relevant data protection law here

Correct answer: A. Explanation: Clear privacy policies help people understand what information is collected and how it may be used.

100. What should organizations do when roles change?

A. Adjust access rights to the new role
B. Keep all former permissions permanently active here
C. Share the employee's password with colleagues here
D. Disable every security control on the account

Correct answer: A. Explanation: Role-based access should reflect current job responsibilities and prevent old privileges from accumulating.
